

REV.IO PSA

SALESFORCE

PRISMATIC

Integration Setup Guide

Version 1.0 · Rev.io Solutions Engineering

Overview

This integration keeps your **Salesforce CRM** and **Rev.io PSA** in sync automatically. Once configured:

- **Salesforce Accounts** sync to Rev.io PSA **Customers**
- **Salesforce Contacts** sync to Rev.io PSA **Contacts**
- **Salesforce Opportunities** can trigger new PSA Opportunities

Salesforce is the system of record for accounts and contacts. Rev.io PSA is the operational system where you manage tickets, billing, and service delivery.

BEFORE YOU START

You'll need: admin access to your

SALESFORCE ORG

, admin access to your

REV.IO PSA TENANT

, and access to your

REV.IO INTEGRATION MARKETPLACE

. Estimated setup time:

20–30 MINUTES

.

STEP 1

Create Custom Fields in Salesforce

The integration uses custom fields to store Rev.io IDs and enable two-way linking. Create these *before* activating the integration.

How to Create a Custom Field

1. Go to **Setup** (gear icon, top right)
2. Search for **Object Manager** in the Quick Find box

3. Click the target object (Account, Contact, or Opportunity)
4. Click **Fields & Relationships** → **New**
5. Choose **Text** (or **Long Text Area** where noted) → click **Next**
6. Enter the field details below → **Next** → **Next** → **Save**

Account Object Fields

Field Label	API Name	Type	Length	Notes
Rev.io ID	Rev_io_ID__c	Text	50	Stores the PSA Customer ID; used to link records
Open PSA Tickets	Open_PSA_Tickets__c	Long Text Area	32,768	Auto-populated with a live open-ticket summary from PSA

☐ **TIP**
For `Open_PSA_Tickets__c`, choose **LONG TEXT AREA** as the type — not plain Text — and set the length to **32,768**.

Contact Object Fields

Field Label	API Name	Type	Length	Notes
Rev.io Contact ID	Rev_io_Contact_ID__c	Text	20	Stores the PSA Contact ID

Opportunity Object Fields

Field Label	API Name	Type	Length	Notes
Rev.io ID	Rev_io_ID__c	Text	50	Stores the PSA Opportunity ID
PSA Client Code	PSA_Client_Code__c	Text	50	Optional — for custom client codes
PSA Bill Profile ID	PSA_Bill_Profile_Id__c	Text	20	Optional — links to a PSA billing profile

NOTE

If you are not using Opportunity sync, you only need to create the Account and Contact fields above.

STEP 2 Get Your Salesforce API Credentials

Reset Your Security Token

1. Log in to Salesforce
2. Click your **profile avatar** (top right) → **Settings**
3. In the left sidebar under *My Personal Information*, click **Reset My Security Token**
4. Click **Reset Security Token** — Salesforce emails it to you immediately

IMPORTANT

Your security token is reset any time you change your Salesforce password. If that happens, regenerate it here and update the integration credentials.

What You'll Need

Item	Where to Find It
Salesforce Username	Your SF login email — e.g. <code>you@yourcompany.com</code>
Salesforce Password	Your SF account password
Security Token	Emailed after the reset above
Instance URL	Your SF org URL — e.g. <code>https://yourcompany.my.salesforce.com</code>

☐ **SANDBOX VS. PRODUCTION**

Sandbox instance URLs look like

`https://yourcompany--sandbox.sandbox.my.salesforce.com`. Make sure you use the URL that matches your environment.

STEP 3 Get Your Rev.io PSA API Key

1. Log in to your **Rev.io PSA** tenant
2. Click your **user avatar** (top right) → **Admin**
3. Navigate to **Admin** → **User Management** → **Users**
4. Click the user you want the integration to run as
5. Scroll to the **API Key** section — copy it, or click **Generate API Key** if none exists

✓ **BEST PRACTICE**

Create a dedicated integration user (e.g. `integration@yourcompany.com`) instead of using a personal account. This keeps the integration running if team members change roles or leave.

STEP 4 Configure the Integration

1. In Rev.io PSA, navigate to the **Integrations** section (or your Rev.io Integration Marketplace link)
2. Find "**Rev.io PSA – Salesforce Integration**" and click **Activate** or **Configure**
3. Complete the three-page wizard below

Page 1 — Credentials

SALESFORCE CONNECTION

- Instance URL
- Username
- Password
- Security Token

REV.IO PSA CONNECTION

- PSA Tenant URL
e.g. <https://yourcompany.psarev.io>
- API Key (from Step 3)

Page 2 — Sync Settings

Setting	Description
Account Type Filter	Only sync SF Accounts with this Account Type (e.g. Rev.io PSA Client). Leave blank to sync all accounts.
Opportunity Stage Filter	Only create PSA opportunities when an SF Opportunity reaches this stage (e.g. Closed Won).
Sync Schedule	How often the scheduled sync runs. Minimum and default is every 12 hours .
Batch Size	Records processed per sync run. The default is suitable for most customers.
Bill Profile ID	Optional. If set, all synced customers will be linked to this Rev.io billing profile.
Debug Mode	Enables verbose execution logs. Recommended off for production.

Page 3 — Opportunity Sync (Optional)

Configure this page only if you want Salesforce Opportunities to create matching PSA Opportunities.

Setting	Description
Trigger Stages	SF Opportunity stages that trigger a new PSA Opportunity (e.g. <code>Closed Won</code>)
Default PSA Stage	PSA opportunity stage assigned at creation (select from dropdown)
Default PSA Type	PSA opportunity type assigned at creation
Default PSA Status	PSA opportunity status assigned at creation
Stage Map	Maps SF stage names to PSA stage names for ongoing status updates
Status Map	Maps SF stages to PSA status names — the wizard auto-suggests Won/Lost for Closed Won/Closed Lost

How the Sync Works

Account ↔ Customer

Salesforce Field	Rev.io PSA Field	Direction
Account Name	Customer Name	SF → PSA
Billing Street	Billing Address	SF → PSA
Billing City / State / Zip	City / State / Zip	SF → PSA
Phone	Phone	SF → PSA
Website	Website	SF → PSA
<code>Rev_io_ID__c</code>	(links the records)	Integration
<code>Open_PSA_Tickets__c</code>	Open ticket summary	PSA → SF

After initial creation, `Rev_io_ID__c` permanently links the records — so re-running the sync never creates duplicates.

Contact ↔ Contact

Salesforce Field	Rev.io PSA Field	Direction
First Name	First Name	SF → PSA
Last Name	Last Name	SF → PSA
Email	Email	SF → PSA
Phone	Phone	SF → PSA
Title	Title	SF → PSA
Rev_io_Contact_ID__c	(links the records)	Integration

Contacts are automatically linked to their parent Account/Customer using the Account relationship in Salesforce.

Sync Modes

☐ SCHEDULED SYNC

Runs every 12 hours by default. Scans all records and syncs anything that has changed since the last run.

⚡ REAL-TIME SYNC

Triggered by Salesforce webhooks on every record change. Updates appear in PSA within seconds.

Troubleshooting

"My accounts aren't syncing"

- Verify the Account's **Account Type** matches your **Account Type Filter** setting exactly — if a filter is set, only accounts with that type sync.
- Confirm `Rev_io_ID__c` exists on the Account object in Salesforce.

"I'm getting authentication errors"

- Salesforce security tokens reset when you change your password — regenerate and update the credentials in the integration config.
- Double-check the PSA API key hasn't been regenerated since setup.

"Contacts are syncing but not linked to the right customer"

- The Contact's related Account in Salesforce must already be synced to PSA first. The contact lookup uses the Account → Customer link.

"Open PSA Tickets isn't populating"

- Confirm `Open_PSA_Tickets__c` is a **Long Text Area** field, not a plain Text field, on the Account object.
-

Support

For integration questions or issues, contact your **Rev.io Solutions Engineer** or open a support ticket at **help.psarev.io**.
